# DEMO2002 - Tutorial 4

Figure 1: Visualising trends in life expectancy, Italy (1921-2020)

The above plot presents the number of survivors at a certain age in Canada, relative to the initial value of 10000. It is observed that from the mid 20th century, there is a marked decrease in the number of the juvenile deaths - i.e. more persons survive past childhood. Additionally, it is seen that the individual plots gradually shift right, indicating an improvement in general life expectancy.
